ICM-40609-D

A TDK SmartMotion™ Solution Designed for Drone Market

GENERAL DESCRIPTION

The ICM-40609-D is a 6-axis MEMS MotionTracking™ device that combines a 3-axis gyroscope and a 3-axis accelerometer designed for the drone market. The ICM-40609-D is form factor compatible with our legacy drone devices – making the transition to the latest offering incredibly simple.

The ICM-40609-D takes advantage of a state-of-the-art architecture design that enhances the IMU's performance and accuracy over temperature, making it the ideal drone solution to control the stability of the platform during long flight times that may experience high temperature shifts.

The ICM-40609-D has a max ODR of 32 KHz, making it the best sampling rate available in a consumer device. The ability to capture data at such a high ODR allows for customers to easily find any anomalies or errors that need to be addressed during flight. The accel Full Scale Range has also been increased to 32g, allowing for substantial linear movement to be easily tracked.

Other industry-leading features include on-chip 16-bit ADCs, programmable digital filters, an embedded temperature sensor, and programmable interrupts. The device features I^2C and SPI serial interfaces, a VDD operating range of 1.71V to 3.6V, and a separate VDDIO operating range of 1.71V to 3.6V.

FEATURES

- Gyro Noise: **4.5mdps/√Hz**
- Gyro Offset Stability TC: ±**10mdps/C**
- Gyro Sensitivity Error: ±**0.5%**
- Gyro Sensitivity/temp: ±**0.045%/C**
- Accel Noise: **100µg/√Hz**
- Accel Offset Stability TC: ±**0.15mg/C**
- Accel Sensitivity Error: ±**0.5%**
- Accel Sensitivity/temp: ±**0.007%/C**
- Gyro + Accel Combo current: **0.77mA**
- Extended Accel Full Scale Range: **32g**
- Improved ODR Latency: **32KHz**

Custom architecture for Improved Thermal Gradient Behavior

- Best-in-class accuracy over temperature

Increased ODR/FSR for max data collection

- 32g Accel Full Scale Range
- 32 KHz ODR Sample Rate

Form Factor Compatible with Legacy Products

- Easily transition from ICM-20602 and MPU-6500
- Only minor pinout changes required

APPLICATIONS

- Drones, Flight Controller

1 INTRODUCTION

1.1 PURPOSE AND SCOPE

This document is a product specification, providing a description, specifications, and design related information on the ICM-40609-D Single-Interface MotionTracking device. The device is housed in a small 3x3x0.91 mm 24-pin LGA package.

1.2 PRODUCT OVERVIEW

The ICM-40609-D is a 6-axis MotionTracking device that combines a 3-axis gyroscope, and a 3-axis accelerometer in a small 3x3x0.91 mm (24-pin LGA) package. It also features a 2 KB FIFO that can lower the traffic on the serial bus interface and reduce power consumption by allowing the system processor to burst read sensor data and then go into a low-power mode. ICM-40609-D, with its 6-axis integration, enables manufacturers to eliminate the costly and complex selection, qualification, and system level integration of discrete devices, guaranteeing optimal motion performance for consumers.

The gyroscope supports eight programmable full-scale range settings from ±15.625 dps to ±2000 dps, and the accelerometer supports four programmable full-scale range settings from ±4g to ±32g.

Other industry-leading features include on-chip 16-bit ADCs, programmable digital filters, an embedded temperature sensor, and programmable interrupts. The device features I^2C and SPI serial interfaces, a VDD operating range of 1.71V to 3.6V, and a separate VDDIO operating range of 1.71V to 3.6V.

The host interface can be configured to support I^2C slave or SPI slave modes. The I^2C interface supports speeds up to 1 MHz, and the SPI interface supports speeds up to 24 MHz.

By leveraging its patented and volume-proven CMOS-MEMS fabrication platform, which integrates MEMS wafers with companion CMOS electronics through wafer-level bonding, InvenSense has driven the package size down to a footprint and thickness of 3x3x0.91 mm (24-pin LGA), to provide a very small yet high-performance low-cost package. The device provides high robustness by supporting 20,000*g* shock reliability.

1.3 APPLICATIONS

- Drones
- Robotics
- IoT Applications

2 FEATURES

2.1 GYROSCOPE FEATURES

The triple-axis MEMS gyroscope in the ICM-40609-D includes a wide range of features:

- Digital-output X-, Y-, and Z-axis angular rate sensors (gyroscopes) with programmable full-scale range of ±15.625, ±31.25, ±62.5, ±125, ±250, ±500, ±1000, and ±2000 degrees/sec
- Low Noise (LN) power mode support
- Digitally programmable low-pass filters
- Factory calibrated sensitivity scale factor
- Self-test

2.2 ACCELEROMETER FEATURES

The triple-axis MEMS accelerometer in ICM-40609-D includes a wide range of features:

- Digital-output X-, Y-, and Z-axis accelerometer with programmable full-scale range of ±4*g*, ±8*g*, ±16*g* and ±32*g*
- Low Noise (LN) and Low Power (LP) power modes support
- User-programmable interrupts
- Wake-on-motion interrupt for low power operation of applications processor
- Self-test

2.3 ADDITIONAL FEATURES

ICM-40609-D includes the following additional features:

- 2KB FIFO buffer enables the applications processor to read the data in bursts
- User-programmable digital filters for gyroscope, accelerometer, and temperature sensor
- Wake on Motion: Detects motion when accelerometer data exceeds a programmable threshold
- 1 MHz I^2C / 24 MHz SPI slave host interface
- Digital-output temperature sensor
- Smallest and thinnest LGA package for portable devices: 3 x 3 x 0.91 mm (24-pin LGA)
- 20,000*g* shock tolerant
- MEMS structure hermetically sealed and bonded at wafer level
- RoHS and Green compliant

Note: The block diagram in Figure 9 is an example. Please refer to the pin-out (section 4.1) for other configuration options.

4.5 OVERVIEW

The ICM-40609-D is comprised of the following key blocks and functions:

- Three-axis MEMS rate gyroscope sensor with 16-bit ADCs and signal conditioning
- Three-axis MEMS accelerometer sensor with 16-bit ADCs and signal conditioning
- I^2C and SPI serial communications interfaces to Host
- Self-Test
- Clocking
- Sensor Data Registers
- FIFO
- Interrupts
- Digital-Output Temperature Sensor
- Bias and LDOs
- Charge Pump
- Standard Power Modes

4.6 THREE-AXIS MEMS GYROSCOPE WITH 16-BIT ADCS AND SIGNAL CONDITIONING

The ICM-40609-D includes a vibratory MEMS rate gyroscope, which detects rotation about the X-, Y-, and Z- Axes. When the gyroscope is rotated about any of the sense axes, the Coriolis Effect causes a vibration that is detected by a capacitive pickoff. The resulting signal is amplified, demodulated, and filtered to produce a voltage that is proportional to the angular rate. This voltage is digitized using on-chip Analog-to-Digital Converters (ADCs) to sample each axis. The full-scale range of the gyro sensors may be digitally programmed to ±15.625, ±31.25, ±62.5, ±125, ±250, ±500, ±1000, and ±2000 degrees per second (dps).

4.7 THREE-AXIS MEMS ACCELEROMETER WITH 16-BIT ADCS AND SIGNAL CONDITIONING

The ICM-40609-D includes a 3-Axis MEMS accelerometer. Acceleration along a particular axis induces displacement of a proof mass in the MEMS structure, and capacitive sensors detect the displacement. The ICM-40609-D architecture reduces the accelerometers' susceptibility to fabrication variations as well as to thermal drift. When the device is placed on a flat surface, it will measure 0*g* on the X- and Y-axes and +1*g* on the Z-axis. The accelerometers' scale factor is calibrated at the factory and is nominally independent of supply voltage. The full-scale range of the digital output can be adjusted to ±4*g*, ±8*g*, ±16*g* and ±32*g*.

4.8 I^2C AND SPI HOST INTERFACE

The ICM-40609-D communicates to the application processor using an I^2C, or SPI serial interface. The ICM-40609-D always acts as a slave when communicating to the application processor.

4.9 SELF-TEST

Self-test allows for the testing of the mechanical and electrical portions of the sensors. The self-test for each measurement axis can be activated by means of the gyroscope and accelerometer self-test registers.

When the self-test is activated, the electronics cause the sensors to be actuated and produce an output signal. The output signal is used to observe the self-test response.

The self-test response is defined as follows:

SELF-TEST RESPONSE = SENSOR OUTPUT WITH SELF-TEST ENABLED – SENSOR OUTPUT WITH SELF-TEST DISABLED

When the value of the self-test response is within the specified min/max limits of the product specification, the part has passed self-test. When the self-test response exceeds the min/max values, the part is deemed to have failed self-test.

4.10 CLOCKING

The ICM-40609-D has a flexible clocking scheme, allowing the following internal clock sources to be used for the internal synchronous circuitry. This synchronous circuitry includes the signal conditioning and ADCs, and various control circuits and registers.

a) An internal relaxation oscillator
b) Auto-select between internal relaxation oscillator and gyroscope MEMS oscillator to use the best available source

The only setting supporting specified performance in all modes is option b). It is recommended that option b) be used when using internal clock source.

4.11 SENSOR DATA REGISTERS

The sensor data registers contain the latest gyroscope, accelerometer, and temperature measurement data. They are read-only registers and are accessed via the serial interface. Data from these registers may be read anytime.

4.12 INTERRUPTS

Interrupt functionality is configured via the Interrupt Configuration register. Items that are configurable include the interrupt pins configuration, the interrupt latching and clearing method, and triggers for the interrupt. Items that can trigger an interrupt are (1) Clock generator locked to new reference oscillator (used when switching clock sources); (2) new data is available to be read (from the FIFO and Data registers); (3) accelerometer event interrupts; (4) FIFO watermark; (5) FIFO overflow. The interrupt status can be read from the Interrupt Status register.

4.13 DIGITAL-OUTPUT TEMPERATURE SENSOR

An on-chip temperature sensor and ADC are used to measure the ICM-40609-D die temperature. The readings from the ADC can be read from the FIFO or the Sensor Data registers.

Temperature data value from the sensor data registers can be converted to degrees centigrade by using the following formula:

Temperature in Degrees Centigrade = (TEMP_DATA / 132.48) + 25

Temperature data stored in FIFO is an 8-bit quantity, FIFO_TEMP_DATA. It can be converted to degrees centigrade by using the following formula:

Temperature in Degrees Centigrade = (FIFO_TEMP_DATA / 2.07) + 25

4.14 BIAS AND LDOS

The bias and LDO section generates the internal supply and the reference voltages and currents required by the ICM-40609-D.

4.15 CHARGE PUMP

An on-chip charge pump generates the high voltage required for the MEMS oscillator.

4.16 STANDARD POWER MODES

Table 11 lists the user-accessible power modes for ICM-40609-D.

MODE	NAME	GYRO	ACCEL
1	Sleep Mode	Off	Off
2	Standby Mode	Drive On	Off
3	Accelerometer Low-Power Mode	Off	Duty-Cycled
4	Accelerometer Low-Noise Mode	Off	On
5	Gyroscope Low-Noise Mode	On	Off
6	6-Axis Low-Noise Mode	On	On

5 SIGNAL PATH

Figure 10 shows a block diagram of the signal path for ICM-40609-D.

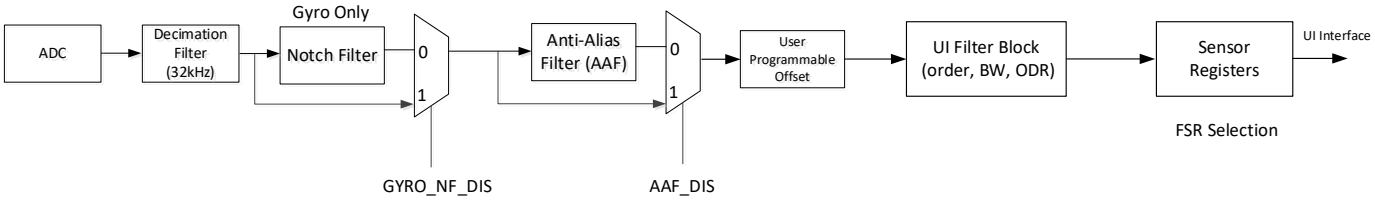

Figure 10. ICM-40609-D Signal Path

The signal path starts with independent 16-bit ADCs for each axis of gyroscope and accelerometer. The ADC output goes through a Decimation Filter that has fixed bandwidth of 32 kHz for ICM-40609-D. Other components of the signal path are described below in further detail.

5.1 NOTCH FILTER

The Notch Filter is supported only for the gyroscope signal path. The following steps can be used to program the notch filter. Note that the notch filter is specific to each axis in the gyroscope, so the X, Y, and Z axis can be programmed independently.

5.1.1 Frequency of Notch Filter (each axis)

To operate the Notch filter, two parameters NF_COSWZ, and NF_COSWZ_SEL must be programmed for each gyroscope axis.

Parameters NF_COSWZ are defined for each axis of the gyroscope as GYRO_X_NF_COSWZ (register bank 1, register 0x0Fh & register 0x12h), GYRO_Y_NF_COSWZ (register bank 1, register 0x10h & register 0x12h), GYRO_Z_NF_COSWZ (register bank 1, register 0x11h & register 0x12h). Note that the parameters have 9-bit values across two different registers.

Parameters NF_COSWZ_SEL are defined for each axis of the gyroscope as GYRO_X_NF_COSWZ_SEL (register bank 1, register 0x12h, bit 3), GYRO_Y_NF_COSWZ_SEL (register bank 1, register 0x12h, bit 4), GYRO_Z_NF_COSWZ_SEL (register bank 1, register 0x12h, bit 5).

Each value must be calculated using the steps described below and programmed into the corresponding register locations mentioned above.

fdesired is the desired frequency of the Notch Filter in kHz. The lower bound for fdesired is 1 kHz, and the upper bound is 3 kHz. Operating the notch filter outside this range is not supported.

Step1: COSWZ = cos(2*pi*fdesired/32)
Step2:

```
If abs(COSWZ)≤0.875
        NF_COSWZ = round[COSWZ*256]
        NF_COSWZ_SEL = 0
else
        NF_COSWZ_SEL = 1
        if COSWZ > 0.875
                NF_COSWZ = round [8*(1-COSWZ)*256]
        else if COSWZ < -0.875
                NF_COSWZ = round [-8*(1+COSWZ)*256]
        end
End
```

5.1.2 Bandwidth of Notch Filter (common to all axes)

The notch filter allows the user to control the width of the notch from eight possible values using a 3-bit parameter GYRO_NF_BW_SEL in register bank 1, register 0x13h, bits 6:4. This parameter is common to all three axes.

GYRO_NF_BW_SEL	Notch Filter Bandwidth (Hz)
0	1449
1	680
2	329
3	162
4	80
5	40
6	20
7	10

The notch filter can be selected or bypassed by using the parameter GYRO_NF_DIS in register bank 1, register 0x0Bh, bit 0 as shown below.

GYRO_NF_DIS	Function
0	Enable notch filter
1	Disable notch filter

5.2 ANTI-ALIAS FILTER

Anti-alias filters for gyroscope and accelerometer can be independently programmed to have bandwidths ranging from 10 Hz to 995 Hz. To program the anti-alias filter for a required bandwidth, use the table below to map the bandwidth to register values as shown:

a. Register bank 2, register 0x03h, bits 6:1, ACCEL_AAF_DELT: Code from 1 to 63 that allows programming the bandwidth for accelerometer anti-alias filter
b. Register bank 2, register 0x04h, bits 7:0 and Bank 2, register 0x05h, bits 3:0, ACCEL_AAF_DELTSQR: Square of the delt value for accelerometer

The anti-alias filter can be selected or bypassed for the gyroscope by using the parameter GYRO_AAF_DIS in register bank 1, register 0x0Bh, bit 1 as shown below.

GYRO_AAF_DIS	Function
0	Enable gyroscope anti-aliasing filter
1	Disable gyroscope anti-aliasing filter

The anti-alias filter can be selected or bypassed for the accelerometer by using the parameter ACCEL_AAF_DIS in register bank 2, register 0x03h, bit 0 as shown below.

ACCEL_AAF_DIS	Function
0	Enable accelerometer anti-aliasing filter
1	Disable accelerometer anti-aliasing filter

5.3 USER PROGRAMMABLE OFFSET

Gyroscope and accelerometer offsets can be programmed by the user by using registers OFFSET_USER0, through OFFSET_USER8, in bank 0, registers 0x77h through 0x7Fh (bank 4) as shown below.

REGISTER ADDRESS	REGISTER NAME	BITS	FUNCTION
0x77h	OFFSET_USER0	7:0	Lower bits of X-gyro offset programmed by user. Max value is ±64 dps, resolution is 1/32 dps.
0x78h	OFFSET_USER1	3:0	Upper bits of X-gyro offset programmed by user. Max value is ±64 dps, resolution is 1/32 dps.
		7:4	Upper bits of Y-gyro offset programmed by user. Max value is ±64 dps, resolution is 1/32 dps.
0x79h	OFFSET_USER2	7:0	Lower bits of Y-gyro offset programmed by user. Max value is ±64 dps, resolution is 1/32 dps.
0x7Ah	OFFSET_USER3	7:0	Lower bits of Z-gyro offset programmed by user. Max value is ±64 dps, resolution is 1/32 dps.
0x7Bh	OFFSET_USER4	3:0	Upper bits of Z-gyro offset programmed by user. Max value is ±64 dps, resolution is 1/32 dps.
		7:4	Upper bits of X-accel offset programmed by user. Max value is ±1 g, resolution is 0.5 g.
0x7Ch	OFFSET_USER5	7:0	Lower bits of X-accel offset programmed by user. Max value is ±1 g, resolution is 0.5 g.
0x7Dh	OFFSET_USER6	7:0	Lower bits of Y-accel offset programmed by user. Max value is ±1 g, resolution is 0.5 g.
0x7Eh	OFFSET_USER7	3:0	Upper bits of Y-accel offset programmed by user. Max value is ±1 g, resolution is 0.5 g.
		7:4	Upper bits of Z-accel offset programmed by user. Max value is ±1 g, resolution is 0.5 g.
0x7Fh	OFFSET_USER8	7:0	Lower bits of Z-accel offset programmed by user. Max value is ±1 g, resolution is 0.5 g.

5.4 UI FILTER BLOCK

The UI filter block can be programmed to select filter order and bandwidth independently for gyroscope and accelerometer.

Gyroscope filter order can be selected by programming the parameter GYRO_UI_FILT_ORD in register bank 0, register 0x51h, bits 3:2, as shown below.

GYRO_UI_FILT_ORD	Filter Order
00	1st order
01	2nd order
10	3rd order
11	Reserved

Accelerometer filter order can be selected by programming the parameter ACCEL_UI_FILT_ORD in register bank 0, register 0x53h, bits 4:3, as shown below.

ACCEL_UI_FILT_ORD	Filter Order
00	1st order
01	2nd order
10	3rd order
11	Reserved

Gyroscope and accelerometer filter 3dB bandwidth can be selected by programming the parameter GYRO_UI_FILT_BW in register bank 0, register 0x52h, bits 3:0, and the parameter ACCEL_UI_FILT_BW in register bank 0, register 0x52h, bits 7:4, as shown below. The values shown in bold correspond to low noise and the values shown in italics correspond to low latency. User can select the appropriate setting based on the application requirements for power and latency. Corresponding Noise Bandwidth (NBW) and Group Delay values are also shown.

5.5 ODR AND FSR SELECTION

Gyroscope ODR can be selected by programming the parameter GYRO_ODR in register bank 0, register 0x4Fh, bits 3:0 as shown below.

GYRO_ODR	Gyroscope ODR Value
0000	Reserved
0001	32 kHz
0010	16 kHz
0011	8 kHz
0100	4 kHz
0101	2 kHz
0110	1 kHz (default)
0111	200 Hz
1000	100 Hz
1001	50 Hz
1010	25 Hz
1011	12.5 Hz
1100	Reserved
1101	Reserved
1110	Reserved
1111	500 Hz

Gyroscope FSR can be selected by programming the parameter GYRO_FS_SEL in register bank 0, register 0x4Fh, bits 7:5 as shown below.

GYRO_FS_SEL	Gyroscope FSR Value
000	±2000 dps
001	±1000 dps
010	±500 dps
011	±250 dps
100	±125 dps
101	±62.5 dps
110	±31.25 dps
111	±15.625 dps

Accelerometer ODR can be selected by programming the parameter ACCEL_ODR in register bank 0, register 0x50h, bits 3:0 as shown below.

ACCEL_ODR	Accelerometer ODR Value
0000	Reserved
0001	32 kHz
0010	16 kHz
0011	8 kHz
0100	4 kHz

1100	6.25 Hz
1101	3.125 Hz
1110	1.5625 Hz
1111	500 Hz

Accelerometer FSR can be selected by programming the parameter ACCEL_FS_SEL in register bank 0, register 0x50h, bits 7:5 as shown below.

ACCEL_FS_SEL	Accelerometer FSR Value
000	±32g
001	±16g
010	±8g
011	±4g

6 FIFO

The ICM-40609-D contains a 2 KB FIFO register that is accessible via the serial interface. The FIFO configuration register determines which data is written into the FIFO. Possible choices include gyroscope data, accelerometer data, temperature readings, and FSYNC input. A FIFO counter keeps track of how many bytes of valid data are contained in the FIFO.

6.1 PACKET STRUCTURE

The following figure shows the FIFO packet structures supported in ICM-40609-D.

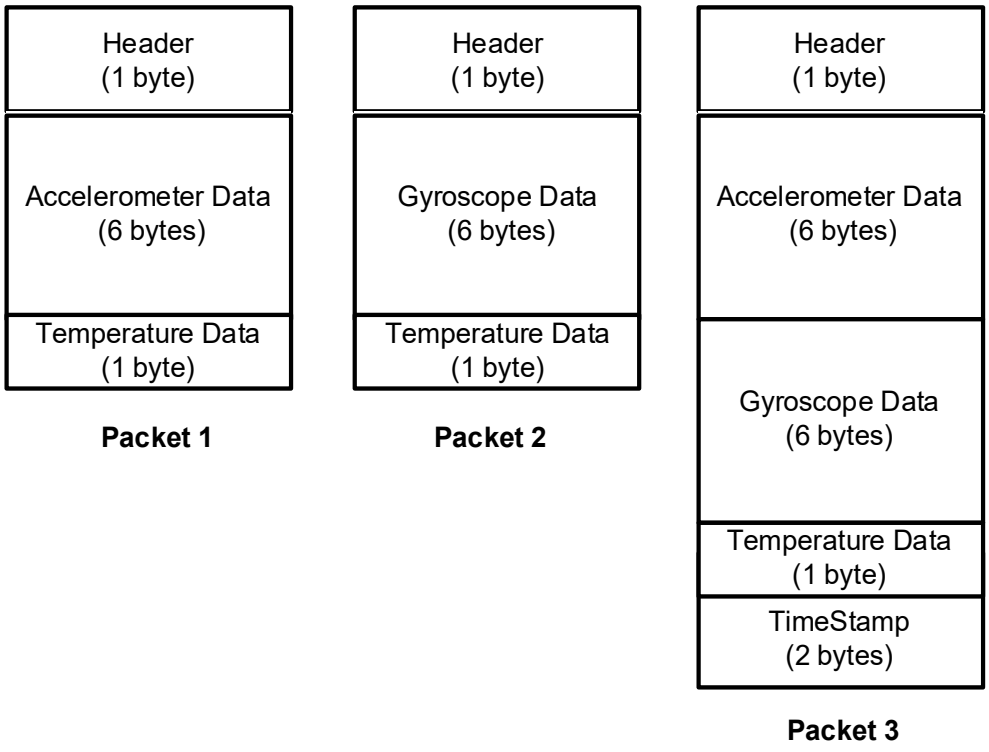

Figure 11. FIFO Packet Structure

The rest of this sub-section describes how individual data is packaged in the different FIFO packet structures.

Packet 1: Individual data is packaged in Packet 1 as shown below.

Byte	Content
0x00	FIFO Header
0x01	Accel X [15:8]
0x02	Accel X [7:0]
0x03	Accel Y [15:8]
0x04	Accel Y [7:0]
0x05	Accel Z [15:8]
0x06	Accel Z [7:0]
0x07	Temperature[7:0]

Packet 2: Individual data is packaged in Packet 2 as shown below.

Byte	Content
0x00	FIFO Header
0x01	Gyro X [15:8]
0x02	Gyro X [7:0]
0x03	Gyro Y [15:8]
0x04	Gyro Y [7:0]
0x05	Gyro Z [15:8]
0x06	Gyro Z [7:0]
0x07	Temperature[7:0]

Packet 3: Individual data is packaged in Packet 3 as shown below.

Byte	Content
0x00	FIFO Header
0x01	Accel X [15:8]
0x02	Accel X [7:0]
0x03	Accel Y [15:8]
0x04	Accel Y [7:0]
0x05	Accel Z [15:8]
0x06	Accel Z [7:0]
0x07	Gyro X [15:8]
0x08	Gyro X [7:0]
0x09	Gyro Y [15:8]
0x0A	Gyro Y [7:0]
0x0B	Gyro Z [15:8]
0x0C	Gyro Z [7:0]
0x0D	Temperature[7:0]
0x0E	TimeStamp[15:8]
0x0F	TimeStamp[7:0]

6.2 FIFO HEADER

The following table shows the structure of the 1-byte FIFO header.

BIT FIELD	ITEM	DESCRIPTION
7	HEADER_MSG	1: FIFO is empty 0: Packet contains sensor data
6	HEADER_ACCEL	1: Packet is sized so that accel data have location in the packet, FIFO_ACCEL_EN must be 1 0: Packet does not contain accel sample
5	HEADER_GYRO	1: Packet is sized so that gyro data have location in the packet, FIFO_GYRO_EN must be 1 0: Packet does not contain gyro sample
3:2	HEADER_TIMESTAMP_FSYNC	00: Packet does not contain timestamp or FSYNC time data 01: Reserved 10: Packet contains ODR Timestamp 11: Packet contains FSYNC time, and this packet is flagged as first ODR after FSYNC (only if FIFO_TMST_FSYNC_EN is 1)
1	HEADER_ODR_ACCEL	1: The ODR for accel is different for this accel data packet compared to the previous accel packet

		0: The ODR for accel is the same as the previous packet with accel
0	HEADER_ODR_GYRO	1: The ODR for gyro is different for this gyro data packet compared to the previous gyro packet 0: The ODR for gyro is the same as the previous packet with gyro

Note at least HEADER_ACCEL or HEADER_GYRO must be set for a sensor data packet to be set.

6.3 MAXIMUM FIFO STORAGE

The maximum number of packets that can be stored in FIFO is a variable quantity depending on the use case. As shown in the figure below, the physical FIFO size is 2048 bytes. A number of bytes equal to the packet size selected (see section 6.1) is reserved to prevent reading a packet during write operation. Additionally, a read cache 2 packets wide is available.

When there is no serial interface operation, the read cache is not available for storing packets, being fed by the serial interface clock.

When serial interface operation happens, depending on the operation length and the packet size chosen, either 1 or 2 of the packet entries in read cache may become available for storing packets. In that case the total storage available is up to the maximum number of packets that can be accommodated in 2048 bytes + 1 packet size, depending on the packet size used.

Due to the non-deterministic nature of system operation, driver memory allocation should always be the largest size of 2080 bytes.

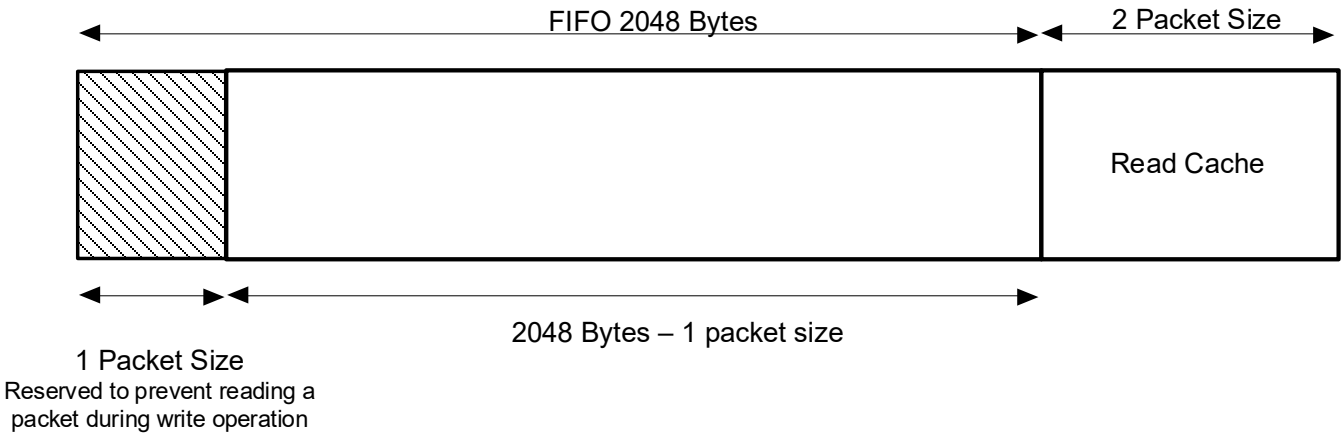

Figure 12. Maximum FIFO Storage

6.4 FIFO CONFIGURATION REGISTERS

The following control bits in bank 0, register 0x5Fh determine what data is placed into the FIFO. The values of these bits may change while the FIFO is being filled without corruption of the FIFO.

BIT	NAME	FUNCTION
3	FIFO_TMST_FSYNC_EN	0: FIFO will only contain ODR timestamp information 1: FIFO can also contain FSYNC time and FSYNC tag for one ODR after an FSYNC event
1	FIFO_GYRO_EN	0: Default setting; Gyroscope data not placed into FIFO 1: Enables gyroscope data packets of 6-bytes to be placed in FIFO
0	FIFO_ACCEL_EN	0: Default setting; Accelerometer data not placed into FIFO 1: Enables accelerometer data packets of 6-bytes to be placed in FIFO

Configuration register settings above impact FIFO header and FIFO packet size as follows:

FIFO_ACCEL_EN	FIFO_GYRO_EN	FIFO_TMST_FSYNC_EN	Header	Packet size
1	1	0	8'b_0110_10xx	16 Bytes
1	1	1	8'b_0110_1xxx	16 Bytes
1	0	X	8'b_0100_00xx	8 Bytes
0	1	X	8'b_0010_00xx	8 Bytes
0	0	X	No FIFO writes	No FIFO writes

7 PROGRAMMABLE INTERRUPTS

The ICM-40609-D has a programmable interrupt system that can generate an interrupt signal on the INT pins. Status flags indicate the source of an interrupt. Interrupt sources may be enabled and disabled individually. There are two interrupt outputs. Any interrupt may be mapped to either interrupt pin as explained in the register section. The following configuration options are available for the interrupts

- INT1 and INT2 can be push-pull or open drain
- Level or pulse mode
- Active high or active low

7.1 WAKE-ON MOTION INTERRUPT

The ICM-40609-D provides motion detection capability. A qualifying motion sample is one where the high passed sample from any axis has an absolute value exceeding a user-programmable threshold. The following steps explain how to configure the Wake-on-Motion Interrupt.

- Wake on Motion configuration parameters
    1. WOM_X_TH (Register 0x4Ah in Bank 4)
    2. WOM_Y_TH (Register 0x4Bh in Bank 4)
    3. WOM_Z_TH (Register 0x4Ch in Bank 4)
    4. WOM_INT_MODE (Register 0x57h in Bank 0)
    5. WOM_MODE (Register 0x57h in Bank 0)
    6. WOM_MODE1 (Register 0x57h in Bank 0)

- Initialize Sensor in a typical configuration
    1. Set accelerometer ODR (Register 0x50h in Bank 0)
       ACCEL_ODR = 9 for 50 Hz
    2. Set Accel to Low Power mode (Register 0x4Eh in Bank 0)
       ACCEL_MODE = 2 and (Register 0x4Dh in Bank 0), ACCEL_LP_CLK_SEL = 0, for low power mode
    3. Wait 1 millisecond

- Initialize Wake on Motion hardware
    1. Set WOM_X_TH to 98 (Register 0x4Ah in Bank 4)
    2. Set WOM_Y_TH to 98 (Register 0x4Bh in Bank 4)
    3. Set WOM_Z_TH to 98 (Register 0x4Ch in Bank 4)
    4. Wait 1 millisecond
    5. Set WOM_INT_MODE to 0 (Register 0x57h in Bank 0)
    6. Set WOM_MODE to 1 (Register 0x57h in Bank 0)
    7. Set WOM_MODE1 to 1 (Register 0x57h in Bank 0)
    8. Wait 1 millisecond
    9. Enable all 3 axes as WOM sources for INT1 by setting bits 2:0 in register INT_SOURCE1 (Register 0x66h in Bank 0) to 1. Or if INT2 is selected for WOM, enable all 3 axes as WOM sources by setting bits 2:0 in register INT_SOURCE4 (Register 0x69h in Bank 0) to 1.
    10. Wait 50 milliseconds

- Output registers
    1. Read interrupt register (Register 0x37h in Bank 0) for WOM_X_INT
    2. Read interrupt register (Register 0x37h in Bank 0) for WOM_Y_INT
    3. Read interrupt register (Register 0x37h in Bank 0) for WOM_Z_INT

8 DIGITAL INTERFACE

8.1 I²C AND SPI SERIAL INTERFACES

The internal registers and memory of the ICM-40609-D can be accessed using I²C at 1 MHz or SPI at 24 MHz. SPI operates in 3-wire or 4-wire mode. Pin assignments for serial interfaces are described in Section 4.1.

8.2 I²C INTERFACE

I²C is a two-wire interface comprised of the signals serial data (SDA) and serial clock (SCL). In general, the lines are open-drain and bi-directional. In a generalized I²C interface implementation, attached devices can be a master or a slave. The master device puts the slave address on the bus, and the slave device with the matching address acknowledges the master.

The ICM-40609-D always operates as a slave device when communicating to the system processor, which thus acts as the master. SDA and SCL lines typically need pull-up resistors to VDDIO. The maximum bus speed is 1 MHz.

The slave address of the ICM-40609-D is b110100X, which is 7 bits long. The LSB bit of the 7-bit address is determined by the logic level on pin AP_AD0. This allows two ICM-40609-Ds to be connected to the same I²C bus. When used in this configuration, the address of one of the devices should be b1101000 (pin AP_AD0 is logic low) and the address of the other should be b1101001 (pin AP_AD0 is logic high).

8.3 I²C COMMUNICATIONS PROTOCOL

START (S) and STOP (P) Conditions

Communication on the I²C bus starts when the master puts the START condition (S) on the bus, which is defined as a HIGH-to-LOW transition of the SDA line while SCL line is HIGH (see figure below). The bus is considered to be busy until the master puts a STOP condition (P) on the bus, which is defined as a LOW to HIGH transition on the SDA line while SCL is HIGH (see figure below).

Additionally, the bus remains busy if a repeated START (Sr) is generated instead of a STOP condition.

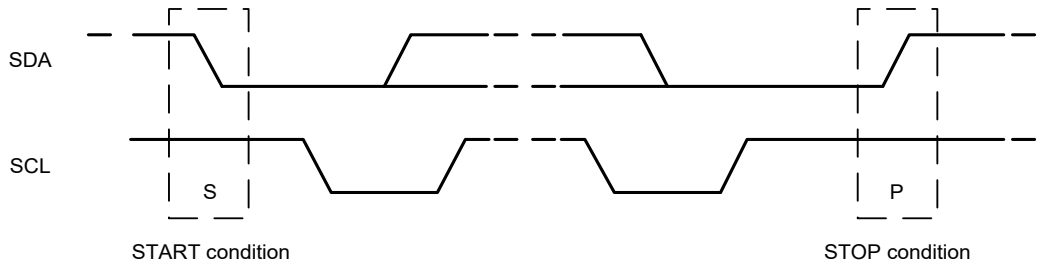

Figure 13. START and STOP Conditions

Data Format / Acknowledge

I²C data bytes are defined to be 8-bits long. There is no restriction to the number of bytes transmitted per data transfer. Each byte transferred must be followed by an acknowledge (ACK) signal. The clock for the acknowledge signal is generated by the master, while the receiver generates the actual acknowledge signal by pulling down SDA and holding it low during the HIGH portion of the acknowledge clock pulse.

If a slave is busy and cannot transmit or receive another byte of data until some other task has been performed, it can hold SCL LOW, thus forcing the master into a wait state. Normal data transfer resumes when the slave is ready, and releases the clock line (refer to the following figure).

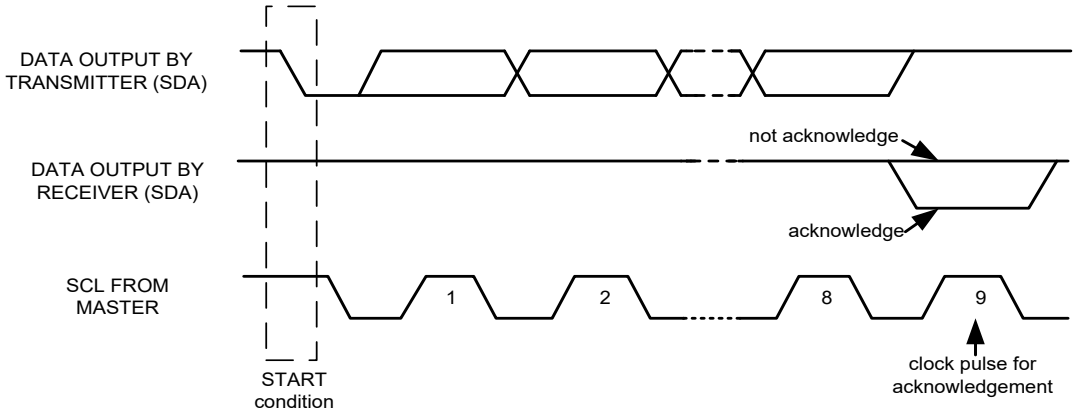

Figure 14. Acknowledge on the I²C Bus

Communications

After beginning communications with the START condition (S), the master sends a 7-bit slave address followed by an 8th bit, the read/write bit. The read/write bit indicates whether the master is receiving data from or is writing to the slave device. Then, the master releases the SDA line and waits for the acknowledge signal (ACK) from the slave device. Each byte transferred must be followed by an acknowledge bit. To acknowledge, the slave device pulls the SDA line LOW and keeps it LOW for the high period of the SCL line. Data transmission is always terminated by the master with a STOP condition (P), thus freeing the communications line. However, the master can generate a repeated START condition (Sr), and address another slave without first generating a STOP condition (P). A LOW to HIGH transition on the SDA line while SCL is HIGH defines the stop condition. All SDA changes should take place when SCL is low, with the exception of start and stop conditions.

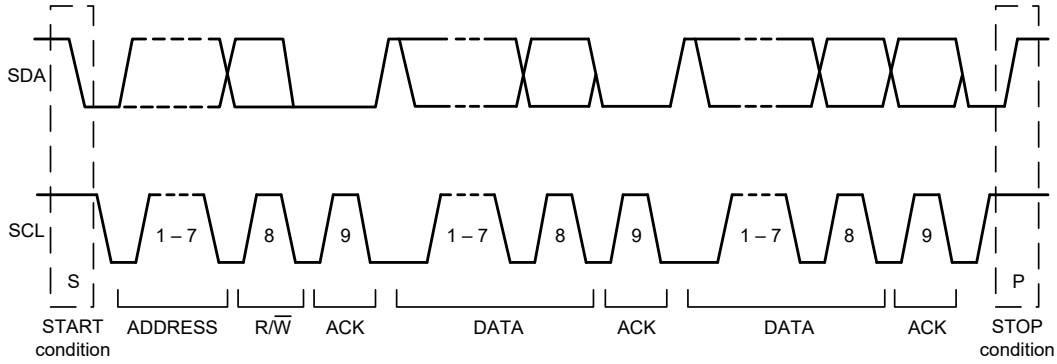

Figure 15. Complete I²C Data Transfer

To write the internal ICM-40609-D registers, the master transmits the start condition (S), followed by the I²C address and the write bit (0). At the 9th clock cycle (when the clock is high), the ICM-40609-D acknowledges the transfer. Then the master puts the register address (RA) on the bus. After the ICM-40609-D acknowledges the reception of the register address, the master puts the register data onto the bus. This is followed by the ACK signal, and data transfer may be concluded by the stop condition (P). To write multiple bytes after the last ACK signal, the master can continue outputting data rather than transmitting a stop signal. In this case, the ICM-40609-D automatically increments the register address and loads the data to the appropriate register. The following figures show single and two-byte write sequences.

Single-Byte Write Sequence

Master	S	AD+W		RA		DATA		P
Slave			ACK		ACK		ACK	

Document Number: DS-000330
Revision: 1.2

Burst Write Sequence

Master	S	AD+W		RA		DATA		DATA		P
Slave			ACK		ACK		ACK		ACK	

To read the internal ICM-40609-D registers, the master sends a start condition, followed by the I^2C address and a write bit, and then the register address that is going to be read. Upon receiving the ACK signal from the ICM-40609-D, the master transmits a start signal followed by the slave address and read bit. As a result, the ICM-40609-D sends an ACK signal and the data. The communication ends with a not acknowledge (NACK) signal and a stop bit from master. The NACK condition is defined such that the SDA line remains high at the 9th clock cycle. The following figures show single- and two-byte read sequences.

Single-Byte Read Sequence

Master	S	AD+W		RA		S	AD+R			NACK	P
Slave			ACK		ACK			ACK	DATA		

Burst Read Sequence

Master	S	AD+W		RA		S	AD+R			ACK		NACK	P
Slave			ACK		ACK			ACK	DATA		DATA		

8.4 I^2C TERMS

Signal	Description
S	Start Condition: SDA goes from high to low while SCL is high
AD	Slave I^2C address
W	Write bit (0)
R	Read bit (1)
ACK	Acknowledge: SDA line is low while the SCL line is high at the 9th clock cycle
NACK	Not-Acknowledge: SDA line stays high at the 9th clock cycle
RA	ICM-40609-D internal register address
DATA	Transmit or received data
P	Stop condition: SDA going from low to high while SCL is high

8.5 SPI INTERFACE

The ICM-40609-D supports 3-wire or 4-wire SPI for the host interface. The ICM-40609-D always operates as a Slave device during standard Master-Slave SPI operation.

With respect to the Master, the Serial Clock output (SCLK), the Serial Data Output (SDO), the Serial Data Input (SDI), and the Serial Data IO (SDIO) are shared among the Slave devices. Each SPI slave device requires its own Chip Select (CS) line from the master.

CS goes low (active) at the start of transmission and goes back high (inactive) at the end. Only one CS line is active at a time, ensuring that only one slave is selected at any given time. The CS lines of the non-selected slave devices are held high, causing their SDO lines to remain in a high-impedance (high-z) state so that they do not interfere with any active devices.

SPI Operational Features

1. Data is delivered MSB first and LSB last
2. Data is latched on the rising edge of SCLK
3. Data should be transitioned on the falling edge of SCLK
4. The maximum frequency of SCLK is 24 MHz
5. SPI read and write operations are completed in 16 or more clock cycles (two or more bytes). The first byte contains the SPI Address, and the following byte(s) contain(s) the SPI data. The first bit of the first byte contains the Read/Write bit and indicates the Read (1) or Write (0) operation. The following 7 bits contain the Register Address. In cases of multiple-byte Read/Writes, data is two or more bytes:

SPI Address format

MSB							**LSB**
R/W	A6	A5	A4	A3	A2	A1	A0

SPI Data format

MSB							**LSB**
D7	D6	D5	D4	D3	D2	D1	D0

6. Supports Single or Burst Read/Writes.

11 USE NOTES

11.1 ACCELEROMETER MODE TRANSITIONS

When transitioning from accelerometer Low Power (LP) mode to accelerometer Low Noise (LN) mode, if ODR is 6.25 Hz or lower, software should change ODR to a value of 12.5 Hz or higher, because accelerometer LN mode does not support ODR values below 12.5 Hz.

When transitioning from accelerometer LN mode to accelerometer LP mode, if ODR is greater than 500 Hz, software should change ODR to a value of 500Hz or lower, because accelerometer LP mode does not support ODR values above 500 Hz.

11.2 ACCELEROMETER LOW POWER (LP) MODE AVERAGING FILTER SETTING

Software drivers provided with the device use Averaging Filter setting of 16x. This setting is recommended for meeting Android noise requirements in LP mode, and to minimize accelerometer offset variation when transitioning from LP to Low Noise (LN) mode. 1x averaging filter can be used by following the setting configuration shown in section 14.38.

11.3 SETTINGS FOR I²C, AND SPI OPERATION

Upon bootup the device comes up in SPI mode. The following settings should be used for I²C, and SPI operation.

Register Field	I²C Driver Setting	SPI Driver Setting
I2C_SLEW_RATE (bits 5:3, register DRIVE_CONFIG, address 0x13, bank 0)	1	0
SPI_SLEW_RATE (bits 2:0, register DRIVE_CONFIG, address 0x13, bank 0)	1	5

11.4 NOTCH FILTER AND ANTI-ALIAS FILTER OPERATION

Use of Notch Filter and Anti-Alias Filter is supported only for Low Noise (LN) mode operation. The host is responsible for keeping the UI path in LN mode while Notch Filter and Anti-Alias Filter are turned on.

11.5 REGISTER VALUES MODIFICATION

The only register settings that user can modify during sensor operation are for ODR selection, FSR selection, and sensor mode changes (register parameters GYRO_ODR, ACCEL_ODR, GYRO_FS_SEL, ACCEL_FS_SEL, GYRO_MODE, ACCEL_MODE). User must not modify any other register values during sensor operation. The following procedure must be used for other register values modification.

- Turn Accel and Gyro Off
- Modify register values
- Turn Accel and/or Gyro On

12 REGISTER MAP

Detailed register descriptions are provided in the sections that follow. Please note the following regarding Clock Domain for each register:

1. Clock Domain: SCLK_UI means that the register is controlled from the UI interface

Register fields marked as Reserved must not be modified by the user. The Reset Value of the register can be used to determine the default value of reserved register fields, and unless otherwise noted this default value must be maintained even if the values of other register fields are modified by the user.

13 USER BANK 0 REGISTER MAP – DESCRIPTIONS

This section describes the function and contents of each register within USR Bank 0.

Invalid Data Generation: FIFO/Sense Registers may contain invalid data under the following conditions:

a) From power on reset to first ODR sample of any sensor (accel, gyro, temp sensor)
b) When any sensor is disabled (accel, gyro, temp sensor)
c) When accel and gyro are enabled with different ODRs. In this case, the sensor with lower ODR will generate invalid samples when it has no new data.

Invalid data can take special values or can hold last valid sample received. For -32768 to be used as a flag for invalid accel/gyro samples, the valid accel/gyro sample range is limited in such case as well. Bit 7 of INTF_CONFIG0 controls what values invalid (and valid) samples can take as shown above.
